

Amendments to the Claims

1 1. (Previously presented) A computer implemented method of performing a
2 transaction in a database system, comprising:
3 receiving a transaction to be performed, wherein the transaction is
4 processed by a plurality of access modules; and
5 before any directive indicating commencement of an end transaction
6 procedure is broadcast to the access modules, performing a flush of a transaction log
7 from volatile storage to non-volatile storage by each of the access modules.

1 2. (Previously presented) The method of claim 1, further comprising issuing
2 a request to flush the transaction log with a message sent to each of the access modules
3 for performing a last step of the transaction, the last step performed prior to
4 commencement of the end transaction procedure.

1 3. (Previously presented) The method of claim 2, further comprising
2 performing the flush of the transaction log in a data access step prior to commencement
3 of the end transaction procedure to avoid performance of a transaction log flush in the
4 end transaction procedure.

1 4. (Previously presented) The method of claim 2, further comprising
2 determining that the last step is being performed by all of the plurality of access modules
3 involved in the transaction.

1 5. (Original) The method of claim 1, further comprising determining if the
2 transaction log has been flushed before performing the end transaction procedure.

1 6. (Original) The method of claim 5, further comprising avoiding
2 performance of a transaction log flush in the end transaction procedure if the transaction
3 log has been flushed.

- 1 7. (Original) The method of claim 1, further comprising:
2 identifying the transaction as an implicit transaction.
- 1 8. (Previously presented) The method of claim 1, further comprising:
2 performing the end transaction procedure.
- 1 9. (Previously presented) The method of claim 8, performing the end
2 transaction procedure comprising:
3 skipping broadcast of the directive indicating commencement of the end
4 transaction procedure to the plurality of access modules.
- 1 10. (Previously presented) A computer implemented method of performing an
2 end transaction procedure in a database system, comprising:
3 after commitment of a transaction, a first access module in the database
4 system writing an end transaction indication to a first transaction log portion in volatile
5 storage, the first access module being part of a cluster of access modules; and
6 the first access module sending an end transaction directive to a fallback
7 access module associated with the first access module, the fallback access module being
8 part of the cluster.
- 1 11. (Previously presented) The method of claim 10, wherein the first access
2 module sends the end transaction directive to the fallback access module but not to other
3 access modules in the cluster.
- 1 12. (Original) The method of claim 10, wherein sending the end transaction
2 directive comprises sending an end transaction-part one directive.
- 1 13. (Previously presented) The method of claim 12, further comprising the
2 fallback access module broadcasting an end transaction-part two directive to all access
3 modules in the cluster.

1 14. (Previously presented) The method of claim 10, further comprising the
2 fallback access module writing an end transaction indication to a second transaction log
3 portion in volatile storage.

1 15. (Previously presented) The method of claim 10, further comprising the
2 first access module flushing the first transaction log portion from volatile storage to non-
3 volatile storage.

1 16. (Previously presented) The method of claim 10, further comprising the
2 first access module flushing the first transaction log portion from volatile storage to non-
3 volatile storage but the other access modules in the cluster not flushing their respective
4 transaction log portions.

1 17. (Previously presented) A database system comprising:
2 persistent storage;
3 volatile storage; and
4 a plurality of access modules, wherein each access module is coupled to
5 the persistent storage and the volatile storage; and
6 each of the access modules being adapted to flush a transaction log
7 maintained by the access module from the volatile storage to the persistent storage before
8 any directive indicating commencement of an end transaction procedure is broadcast to
9 the access modules.

1 18. (Previously presented) The database system of claim 17, further
2 comprising a controller adapted to determine if each access module has flushed the
3 transaction log maintained by the access module before commencement of the end
4 transaction procedure.

1 19. (Previously presented) The database system of claim 18, wherein the
2 controller is adapted to skip sending a directive to perform a transaction log flush if the

3 controller determines that each access module has flushed the transaction log before
4 commencement of the end transaction procedure.

1 20. (Previously presented) The database system of claim 17, further
2 comprising a controller adapted to provide a flush directive with a message to each of the
3 access modules to perform a last step of the transaction before commencement of the end
4 transaction procedure.

1 21. (Previously presented) An article comprising a computer readable storage
2 medium storing instructions for enabling a processor-based system to:
3 receive a transaction to be performed, wherein the transaction is processed
4 by a plurality of access modules;
5 determine that a last step of the transaction involves the plurality of access
6 modules, wherein the last step is performed before any directive indicating
7 commencement of an end transaction procedure is broadcast to the access modules; and
8 flush a transaction log from volatile storage to a non-volatile storage while
9 the last step is performed by the plurality of access modules.

1 22. (Previously presented) The article of claim 21, further storing instructions
2 for enabling the processor-based system to:
3 perform the end transaction procedure, wherein the end transaction
4 procedure follows execution of the last step of the transaction.

1 23. (Previously presented) The article of claim 22, further storing instructions
2 for enabling the processor-based system to:
3 avoid broadcast of any directive indicating commencement of the end
4 transaction procedure to the plurality of access modules.

1 24. (Previously presented) A computer implemented method of performing a
2 transaction in a database system, comprising:

3 receiving a transaction to be performed on plural access modules in the
4 database system;
5 maintaining a log in volatile storage to track operations performed in the
6 transaction; and
7 writing the log to persistent storage before any directive indicating
8 commencement of an end transaction procedure is broadcast to the plural access modules.

1 25. (Original) The method of claim 24, wherein writing the log to persistent
2 storage comprises flushing the log.

1 26. (Original) The method of claim 24, wherein maintaining the log comprises
2 maintaining a transaction log.

1 27. (Original) The method of claim 24, further comprising performing the end
2 transaction procedure, the end transaction procedure comprising writing an end
3 transaction indication into the log.

1 28. (Previously presented) A database system comprising:
2 persistent storage;
3 volatile storage;
4 access modules coupled to the persistent storage and the volatile storage;
5 and
6 a parsing engine coupled to the access modules, the parsing engine
7 adapted to perform one of:
8 (a) providing a directive with a message to perform a last step
9 of a transaction and communicating the directive to the access modules, each access
10 module responsive to the directive to perform a transaction log flush from the volatile
11 storage to the persistent storage before any directive indicating commencement of an end
12 transaction procedure is broadcast to the access modules; and
13 (b) determining if each of the access modules has performed a
14 transaction log flush before start of the end transaction procedure;

15 the parsing engine adapted to avoid sending a broadcast directive to the
16 access modules to cause performance of a transaction log flush during the end transaction
17 procedure.

1 29. (Previously presented) The method of claim 1, wherein the transaction
2 comprises plural steps, the method further comprising:
3 performing the plural steps prior to performing the end transaction
4 procedure, and
5 wherein performing the flush of the transaction log comprises performing
6 the flush of the transaction log in one of the plural steps.

1 30. (Previously presented) The method of claim 29, wherein performing the
2 plural steps comprises performing, in each of the plural steps, access of relational table
3 data stored in the database system.

1 31. (Previously presented) The method of claim 29, wherein performing the
2 flush of the transaction log in one of the plural steps comprises performing the flush of
3 the transaction log in a last one of the plural steps.

1 32. (Previously presented) The method of claim 1, further comprising each
2 access module adding a first entry to the transaction log to redo the transaction by the
3 access module in case of system failure.

1 33. (Previously presented) The method of claim 4, wherein performing the
2 flush of the transaction log is prior to commencement of the end transaction procedure if
3 the last step is performed by all of the plurality of access modules, the method further
4 comprising:

5 performing the flush of the transaction log in the end transaction
6 procedure if the last step is not performed by all of the plurality of access modules.

1 34. (Previously presented) The database system of claim 17, wherein the
2 access modules are further adapted to perform a transaction comprising plural steps, and
3 to perform the flush of the transaction log in one of the plural steps.

1 35. (Previously presented) The database system of claim 34, wherein the one
2 of the plural steps comprises a last one of the steps.

1 36. (Previously presented) The database system of claim 35, wherein the
2 transaction log comprises a first entry associated with each access module to enable a
3 redo of the transaction in case of system failure.

1 37. (Previously presented) The database system of claim 36, wherein the
2 transaction log further comprises a second entry associated with each access module to
3 enable an undo of the transaction.

1 38. (Previously presented) The database system of claim 34, further
2 comprising a controller adapted to determine whether a last one of the steps involves all
3 the access modules, and in response to determining that the last one of the steps involves
4 all the access modules, the controller further adapted to send a directive to all the access
5 modules to perform the flush of the transaction log in the last one of the steps.

1 39. (Previously presented) The database system of claim 38, in response to
2 determining that the last step does not involve all access modules, the controller further
3 adapted to send a directive to perform the flush of the transaction log in the end
4 transaction procedure.

1 40. (Previously presented) The article of claim 21, wherein the transaction
2 comprises plural steps, the article further storing instructions for enabling the processor-
3 based system to:
4 perform the plural steps prior to commencement of the end transaction
5 procedure, and

6 wherein performing the flush of the transaction log comprises performing
7 the flush of the transaction log in one of the plural steps.

1 41. (Previously presented) The article of claim 40, wherein performing the
2 plural steps comprises performing, in each of the plural steps, access of relational table
3 data stored in a database system.

1 42. (Previously presented) The article of claim 40, wherein performing the
2 flush of the transaction log in one of the plural steps comprises performing the flush of
3 the transaction log in a last one of the plural steps.

1 43. (Previously presented) The article of claim 42, further storing instructions
2 for enabling the processor-based system to cause each access module to add a first entry
3 to the transaction log to redo the transaction by the access module in case of system
4 failure.
